FMCG SALES PERFORMANCE DASHBOARD (2022-2024)

Data Source: Kaggle (FMCG 2022-24 Daily Sales)

Business Problem

Sales & Marketing lacked a centralized dashboard for monitoring historical sales performance

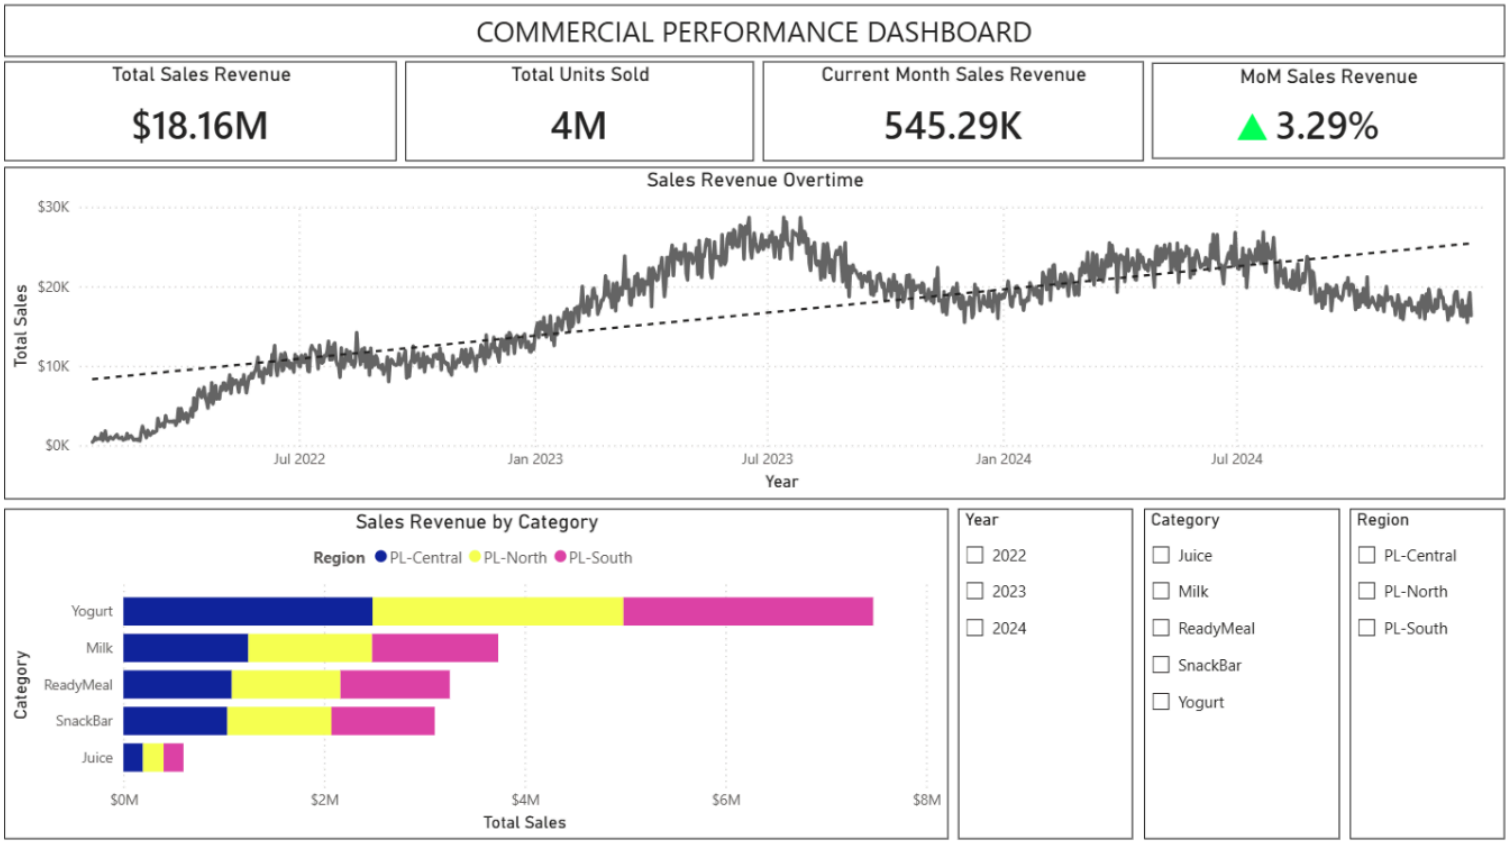

Business Questions

- How has FMCG sales performance evolved from 2022-2024?
- How does sales performance vary across brands, regions, channels, and promotional periods?
- What historical growth and seasonal patterns can be observed, and what does the unit sales forecast suggest for the following year?

Approach

- Cleaned and structured the transaction data in Power Query.
- Developed DAX-based KPIs and time-intelligence measures to track sales performance and growth trends.
- Structured the analysis by establishing the overall performance picture, examining how performance varies across dimensions & promotion, and exploring growth, seasonality, & future outlook.

Executive Overview

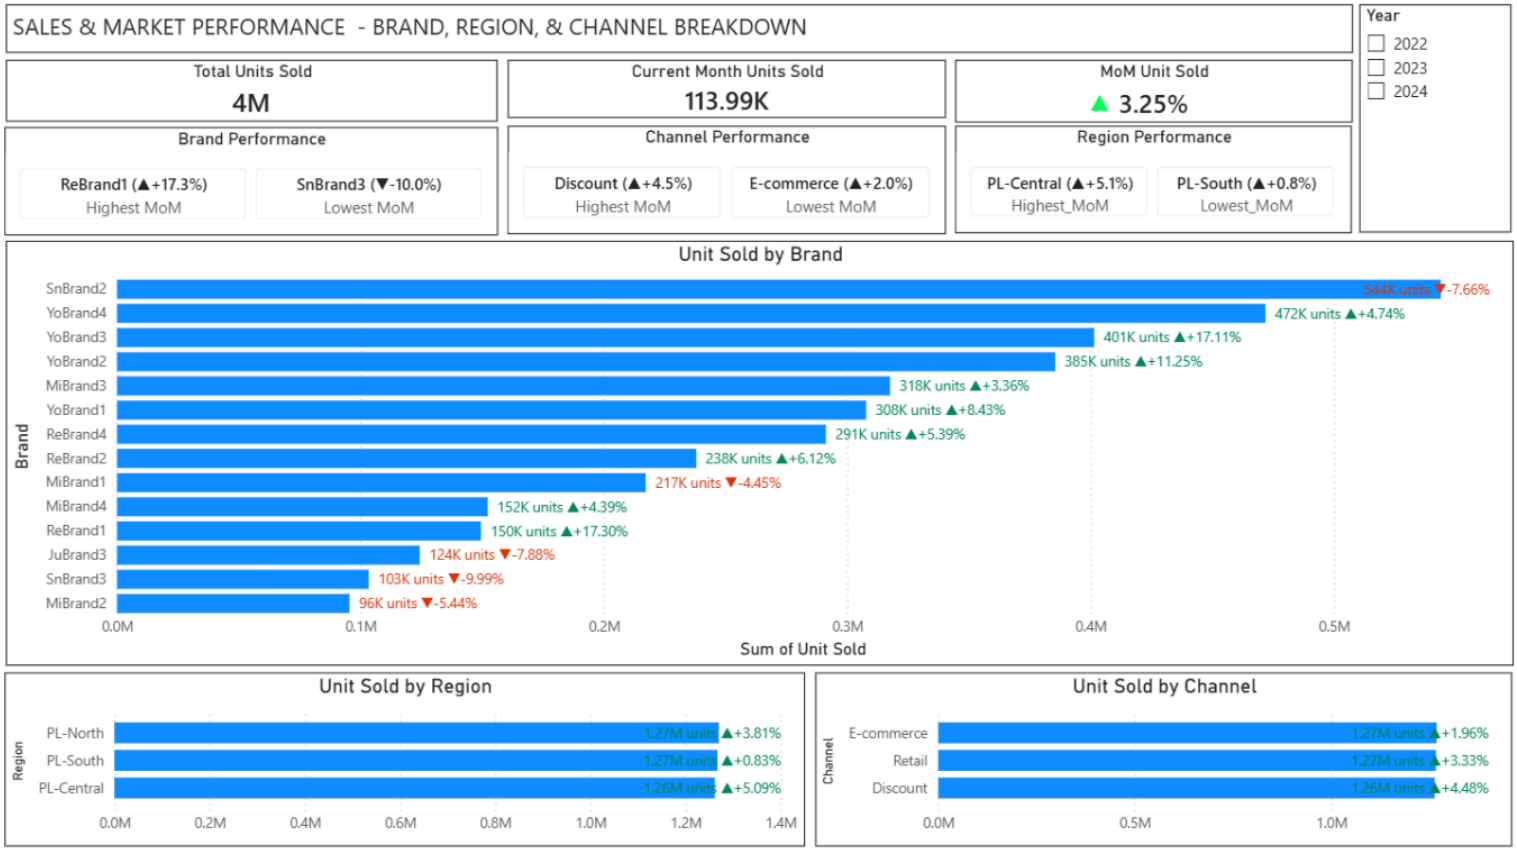

Key Insights

- Revenue and units sold track closely at the aggregate level, but unit price shows no clear relationship to demand.
- Sales performance grew from 2022 to a peak in 2023, followed by a decline in 2024.

Recommendations

- Use Revenue to monitor overall business size and use Units Sold for deeper performance diagnosis, since price shows no clear relationship to demand.
- Conduct further analysis using internal and external factors, such as competitor activity, pricing changes, market conditions, to investigate 2023 peak and 2024 decline, since the current dataset cannot explain causality.
- Use 2023 peak-period performance as a benchmark when evaluating 2025 targets, alongside the 2025 forecast and broader business context.

FMCG Sales Performance Dashboard (cont.)
Sales & Market Performance

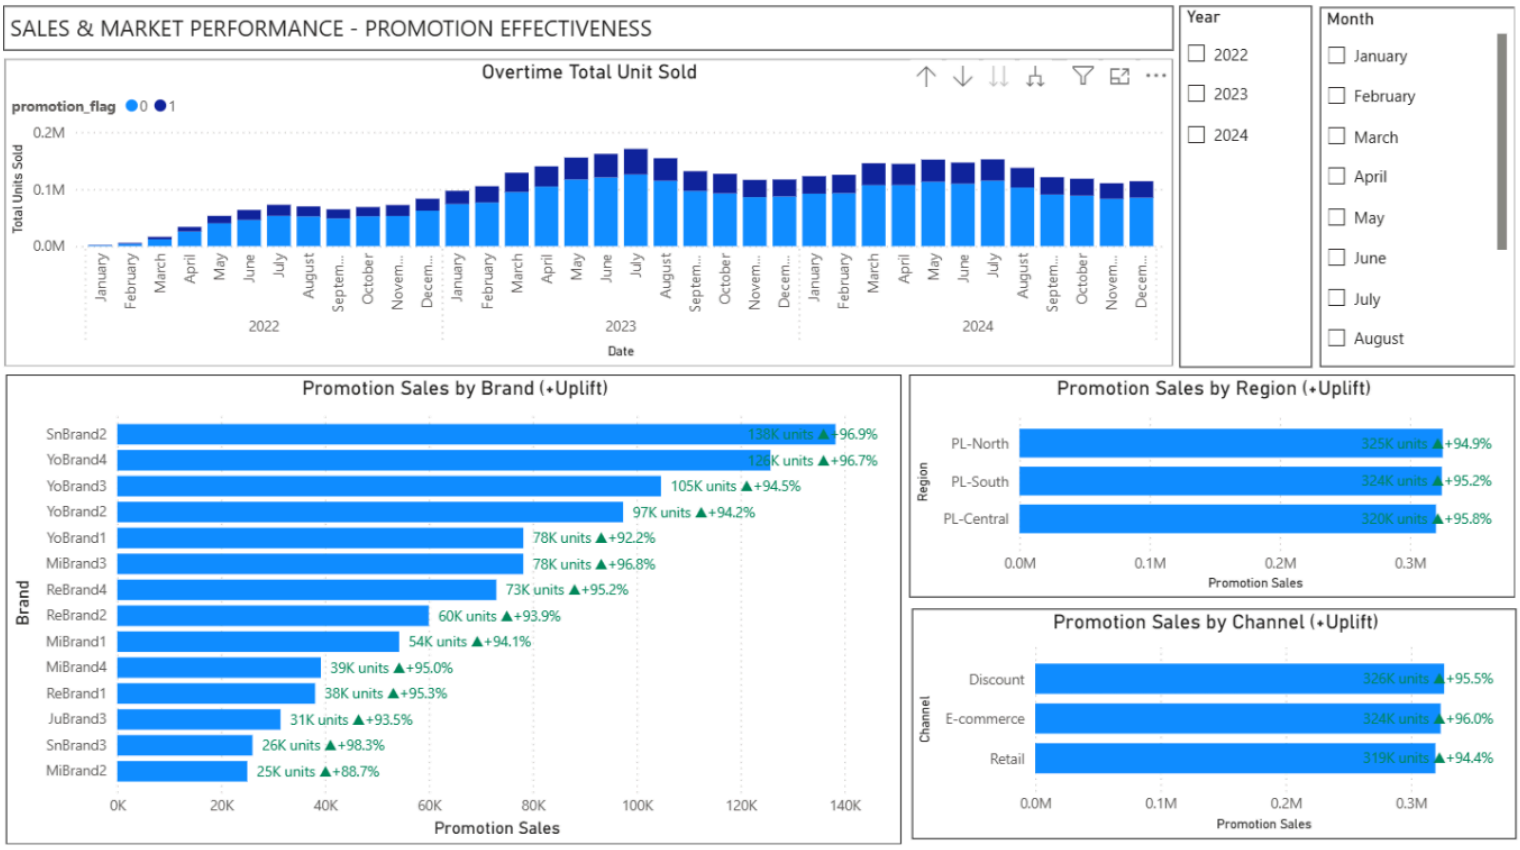

Key Insights

- Yogurt generates significantly higher unit sales than Milk despite having the same number of brands (4), suggesting genuine category-level demand differences rather than portfolio size.
- The largest brands by unit volume don't necessarily have the strongest MoM growth, indicating that scale and recent momentum differ.
- Unit volume is relatively evenly distributed across regions and channels, although the recent MoM growth rates differ.

Recommendations

- Investigate the factors associated with Yogurt's stronger performance relative to Milk to identify potential success or decline factors.
- Further examine the high-volume brand showing declining momentum to understand the factors behind its performance.
- Since volume is relatively evenly distributed, monitor momentum alongside volume, to identify regions and channels with stronger or weaker recent growth.

FMCG Sales Performance Dashboard (cont.)
Sales & Market Performance

Key Insights

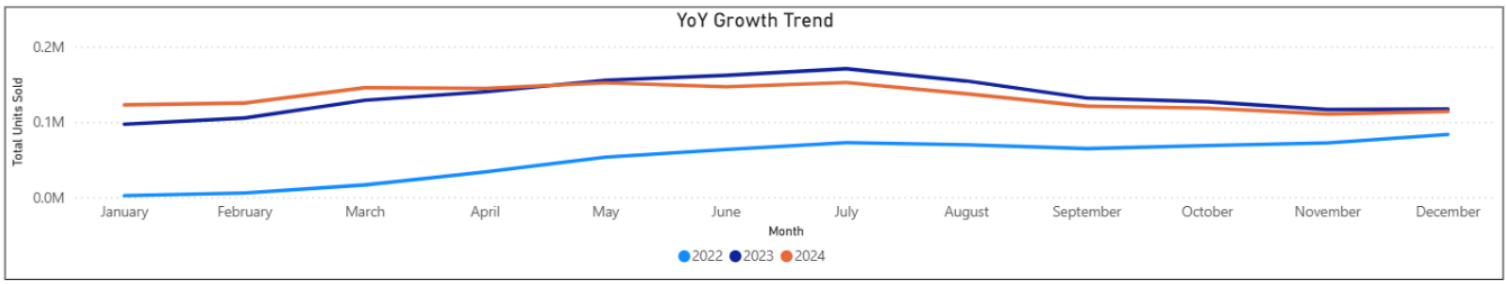

- ~85% of total unit sales occur outside promotional periods, indicating the majority of sales volume is generated during non-promotional periods.
- Promotion uplift is uniformly high (~90%-96%) across every dimension tested (brands, regions, and channels), suggesting the effect isn't dimension-specific.
- The unusually uniform uplift across all dimensions is likely reflecting the dataset's synthetic generation rather than genuine promotional effectiveness.

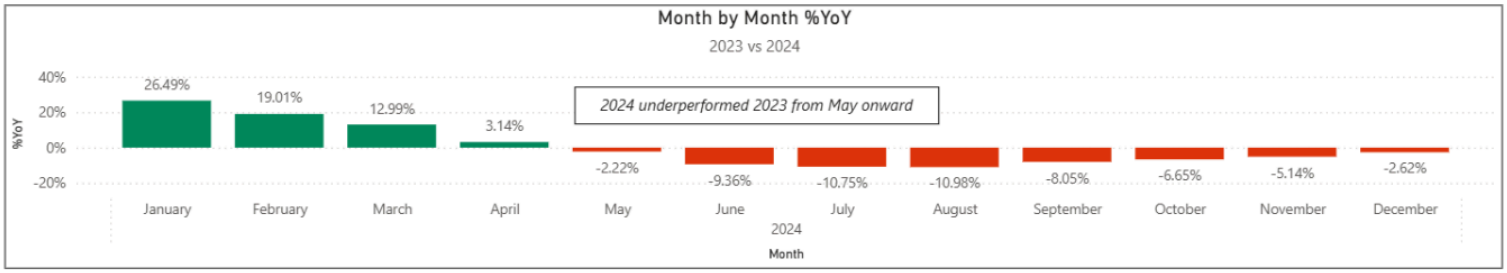

Recommendations

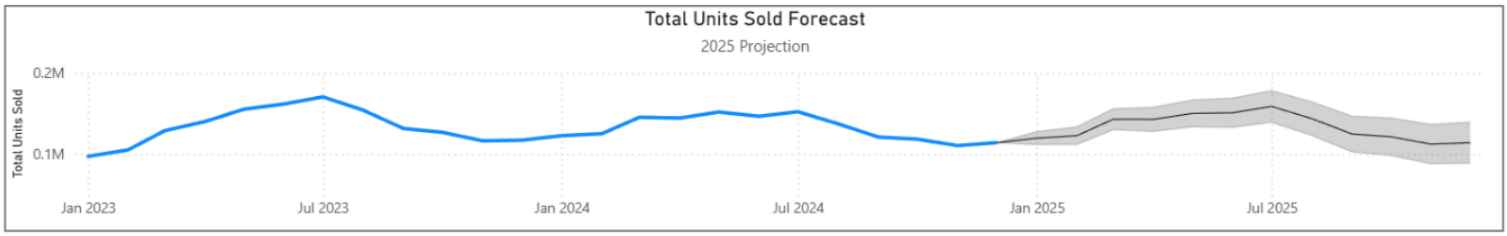

- Continue treating promotions as a supplementary lever rather than the core sales strategy, given non-promo periods drive the majority of volume.
- Monitor the promotion to non-promotion sales ratio over time to detect any shift toward growing discount-dependency.
- Validate promotional effectiveness using more granular promotion and business data before using the observed uplift to guide promotional strategy.

GROWTH AND FORECAST DASHBOARD	Projected Peak Volume (Jul-2025): 158,901 Units

Key Insights

- 2023 and 2024 share a consistent seasonal pattern, with both peaking in July, indicating a recurring annual trend.
- 2024 started ahead of 2023 (January-April), but underperformed May onward, despite the shared seasonal pattern.
- The 2025 forecast is based on 2 years of historical data with 12-month seasonality, resulting in a wide forecast interval of roughly ~16K-51K units around the projected value, indicating substantial uncertainty in the projection.

Recommendations

- Use July's recurring seasonal peak to proactively plan budget, campaigns, and operational capacity ahead of the high-demand period.
- Investigate factors behind 2024's stronger early performance (Jan-Apr) and its underperformed from May onward, using 2023 as a comparison baseline and additional business data.
- Treat the 20205 forecast as a directional guide, rather than an exact target. Validate against internal and external factors before setting firm targets.
